Types of Inverters. There are several types of inverters that might be installed as part of a solar system. In a large-scale utility plant or mid-scale community solar project, every solar panel might be attached to a single central inverter. String inverters connect a set of panels--a string--to one inverter. That inverter converts the power produced by the entire string to AC.

String inverters generally last between 10 and 12 years, while solar panels last for 25 years or more. Getting a new string inverter could cost about \$1,500. In fact, as standard, a solar panel tends to be about 85% efficient (15% energy lost in the conversion). What this means when it comes to inverters, is that you must ensure your solar panels still produce enough wattage to meet the minimum requirements of the inverter, even after energy loss/efficiency has been taken into consideration.

Step-by-Step Guide to Connecting Solar Panels to an Inverter 1. Install the Solar Panels. First, you need to mount the solar panels in a location that gets plenty of sunlight. If you're installing them on your roof, follow these steps: Positioning: Place the panels where they will receive the most sunlight, usually a south-facing roof.
