Does BMW E60 support battery registration?

Now would be great to have the battery registration codes for each amp/hr battery group that can go in an e60. See the latest Android version of BMWhat app, it supports battery registration. This is good info. I saved it to my drive. Now would be great to have the battery registration codes for each amp/hr battery group that can go in an e60.

What is a body-Gateway module E60 E61 E63 E64 mirror?

Body-gateway module E60,E61,E63,E64 mirrors. mirror. The body-gateway module (KGM) controls the mirror electronics via the LIN-bus. The mirror electronics controls the mirror heating in connection with power semiconductors. The KGM sends information relating to the heating capacity (percentage ON time) via the LIN-bus.

How does the E60 PDC system work?

The E60 is equipped with the 8-channel PDC system already known from the E65. The PDC button is integrated in the center console switch center SZM. In the E60 the button signal is forwarded via the K-CAN to the PDC control unit. The PDC sensors for front and rear introduced in the E65 are used as sensors here.

How does the E60 light switch work?

In the E60, the light switch contributes to improved protection for the occupants. This increased level of protection is achieved by artificially enlarging the impact surface of the light switch. In the event of an accident, a person sitting behind the steering wheel could knock against the light switch with his/her knee for instance.

How does a manual gearbox E60 work?

In the E60 the button signal is forwarded via the K-CAN to the PDC control unit. The PDC sensors for front and rear introduced in the E65 are used as sensors here. For a manual gearbox, the signal for reverse gear is made available by the light module by way of a K-CAN message.

What type of alternator does a BMW use?

Alternators manufactured by Bosch and by Valeo are installed on 5- and 6-Series vehicles. Air-cooled alternator models are used. The alternator model used depends on the engine installed and the vehicle's equipment specification. Diagnosis with BMW diagnosis system. The IBS has a fault memory. Fault-memory entries are read off by the DME /DDE.

& nbsp; In electrical and hybrid powertrains, the new 48V electrical architecture pushes the limit with regard to electromagnetic compatibility and safety requirements. Optical Ethernet technology brings in its inherent galvanic isolation and mechanical robustness, providing the ideal network for current and future in-vehicle connectivity.

1. Car difficult to start/won't start 2. Car won't release key (when i push it in, it clicks but key won't pop out until trying a few times) 3. I hear a relay going crazy when I turn off the car. The lights flicker and sometimes won't turn off until pressing the power button a few times.

Overall, the electrical system of the BMW E60 is a complex network of components and modules that work together to provide power and control to various electrical functions in the vehicle. Proper understanding and maintenance of this system is essential for ensuring the reliable and safe operation of the vehicle.

The vehicle electrical system of the E63/64 is essentially based on the electrical system of the E60. This documentation describes the differences in the power supply, bus systems and in the general vehicle electrical system compared to the E60. In the E60/E63, an energy management function is responsible for the power require-

as a primary power distribution point and bus system gateway. To ensure balanced energy management in the vehicle an energy management function similar to that used in the E60 is utilized and is incorporated into the operating software of the DME. The power supply system in the E90 consists of the following: Vehicle Electrical System
