

Bulk power system vs bulk electric system

What is a bulk power system (BPS)?

NERC defines the bulk power system (BPS) as the facilities and control systems necessary for operating an interconnected electric energy transmission network (or any portion thereof); and electric energy from generation facilities needed to maintain transmission system reliability.

What is a bulk electric system?

Bulk Electric System: Unless modified by the lists shown below, all Transmission Elements operated at 100 kV or higher and Real Power and Reactive Power resources connected at 100 kV or higher. This does not include facilities used in the local distribution of electric energy.

fine Bulk-Power System? What equipment is included/excluded? The Bulk-Power System is the facilities and control systems necessary for operating an interconnected electric transmission network, to include those lines rated at 69 kV or more, and

Does NERC use the term 'bulk power system'?

NERC's reliability standards, however, do not generally use the term "bulk-power system." The current standards were adapted from NERC's pre-EPA Act operating policies and planning standards, which used the term "Bulk Electric System" or "BES" to identify their scope.

What are the components of bulk power system reliability?

Reliability is often measured and evaluated separately on the distribution network and the transmission/generation network. Components of bulk power system reliability include three elements that we refer to in this document as the "three R's": resource adequacy, operational reliability, and resilience (Geocariss 2022). Figure 1.

Why is reliability important in a bulk power system?

Maintaining reliability of the bulk power system, which supplies and transmits electricity, is a critical priority for electric grid planners, operators, and regulators. As we move toward a cleaner electricity system with more technologies like wind, solar, and battery storage, the way in which we plan for and achieve reliability will change.

The "bulk electric system" (BES) defined in FERC's new rule is actually a subset of the BPS. Whereas the BPS establishes the outer limits of FERC's jurisdiction, the BES determines which BPS facilities must comply with mandatory reliability standards. 11 NERC's Rules of Procedure, which were approved by FERC, establish that owners and operators of ...

The authors then present for the first time quantitative information on the reliability of each portion of the US electric power system. When reliability is measured using the system average interruption duration index and the system average interruption frequency index, they find that the distribution system accounts for at least 94 and 92% ...
