

# Coincidence factor in power system

What is coincidence factor?

The coincidence factor is the ratio of the maximum demand of a system, or part under consideration, to the sum of the individual maximum demands of the subdivisions. The factor  $k_s$  is applied to each group of loads (e.g. being supplied from a distribution or sub-distribution board).

What is the difference between coincidence factor and diversity factor?

1.4.2 Coincidence Factor. The coincidence factor is the ratio of the maximum demand of a system, or part under consideration, to the sum of the individual maximum demands of the subdivisions or 1.4.3 Diversity Factor. The diversity factor is the reciprocal of the coincidence factor or 1.4.4 Load factor.

What is the difference between demand factor and coincidence factor?

The demand factor is the ratio of maximum demand of a system to the total connected load of the system or Equation: 1.4.2 Coincidence Factor. The coincidence factor is the ratio of the maximum demand of a system, or part under consideration, to the sum of the individual maximum demands of the subdivisions or 1.4.3 Diversity Factor.

What is the highest possible coincidence factor?

Coincidence factor is the peak of a system divided by the sum of peak loads of its individual components. It tells how likely the individual components are peaking at the same time. The highest possible coincidence factor is 1, when all of the individual components are peaking at the same time.

What determines the individual load coincidence factor?

The number of individual loads in a group and their load factors influence the individual load coincidence factor. The coincidence factors in table 8 apply for groups of 100 or more individual loads. These coincidence factors can also be used for groups of as few as 30 to 50 individual loads if their load factor is 0.30 or greater.

What is the Intergroup coincidence factor?

1.00. If loads of a varying nature (evening loads and daytime loads) are combined, the intergroup coincidence factor should be in the range of 0.70 to 1.00. The lower values will occur when magnitudes of the loads are nearly balanced, and the higher ones when the combined load is predominantly one type. 2.3.3 Load Growth.

the system. Therefore, the utilization factor ( $F_u$ ) is ... Coincidence Factor It is the ratio of the maximum coincident total demand of a group of consumers to the sum of the maximum power demands of individual . 10 consumers comprising the group both taken at ...

The ratio of the sum of the individual peak demands in a system to the peak demand of the whole system. The diversity factor is greater than or equal to one and is the reciprocal of the coincident factor. Go to Index ?. Responsibility factor. The ratio of a load's demand at the time of the system peak to its peak demand.

# Coincidence factor in power system

This set of Power Systems Multiple Choice Questions & Answers (MCQs) focuses on "Economics of Power Generation". 1. What is the advantage of sectionalizing of power plant? ... Explanation: Coincidence factor is the ratio of total maximum demand to the sum of individual maximum demands which is the reciprocal of diversity factor.

Coincidence factor is the peak of a system divided by the sum of peak loads of its individual components. It tells how likely the individual components are peaking at the same ...

Five terms are essential to the analysis of load characteristics: demand factor, coincidence factor, diversity factor, and maximum demand. These terms are defined in paragraphs 1.4.1 through ...

The coincidence factor defined at each customer depends on the analyzed grid element, hence, ... Three scenarios assess the potential future energy system of Austria, focusing on the power grid ...

The coincidence factor takes account for this behavior calculating the demand of several customers. In this paper the characteristics of residential loads are shown and several options for the ...

Download scientific diagram | Comparison of different approaches to applying coincidence factors (CF) regarding the required transformer-and line extensions (7114 LV grids simulated). from ...

PF - power factor; Go back to currents and power calculations ?. Example of a fluorescent luminaire and electronic ballast. The nominal active power consumed by the luminaire is 9 W, and the measured apparent power is 16 VA. The measured displacement factor is  $\cos\phi = 0.845$  and the power factor  $PF = 0.56$ . The measured current consumed  $I_a$  is ...

The coincidence factor is the ratio of the maximum demand of a system, or part under consideration, to the sum of the individual maximum demands of the subdivisions. Coincidence factor = Maximum system demand / Sum of ...

It should be remembered that in reality all the individual loads do not necessarily operate at full nominal power nor necessarily at the same time. To be able to estimate the maximum current the standard has defined three factors, Factor of maximum utilization ( $k_u$ ). Diversity factor - Coincidence factor ( $k_s$ ). expansion factor ( $k_{ext}$ ).  $I_B = I_n \cdot k_u$  ...

The coincidence factor is the ratio of the maximum demand of a system, or part under consideration, to the sum of the individual maximum demands of the subdivisions or ... Engineering Code > E Electrical Engineering Preliminary Considerations > 2 Estimation of Loads > 2.3 Area Loads > 2.3.2 Coincidence Factor > 2.3.2.3 Electric Power Consumption.

Power Systems-I 2. Power Systems-II III. COURSE OBJECTIVE: 1 To know about practical electrical

# Coincidence factor in power system

distribution system and its necessity in the real ... Coincidence factor, contribution factor loss factor - Relationship between the load factor and loss factor. Classification of loads: Residential, commercial, Agricultural and Industrial loads and ...

Diversity factor = The reciprocal of the coincidence factor. It means it will always be  $\geq 1$ . Note: In practice, the most commonly used term is the diversity factor, but it is used in replacement of the coincidence factor, thus will be always  $\leq 1$ . The term "simultaneity factor" is another alternative that is sometimes used.

Consider the Coincidence Factor in the Supply System. A coincidence factor is not entered directly in TOP-Energy to calculate the demands. The following procedure has proven to be useful to nevertheless take a simultaneity factor ...

Coincidence factor is the fraction of the peak demand of a population that is in operation at the time of system peak. Thus it is the ratio of the population's demand at the time of the system peak to its noncoincident peak demand. ... DSM can be beneficial to the power system thanks to reduced electric power peak demands, higher operational ...

A good coincidence factor for an efficiency measure might be 70% or higher. An example of a measure with poor coincidence factors is parking-lot lighting. ... In the first post in this data center series, I introduced the staggering power density of neural computing systems used for artificial intelligence. At the macro level, in Northern ...

Load factor 3. Coincident factor 4. Diversity factor 5. Responsibility factor Demand The load average over a specified time period, often 15, 20, or 30 minutes. Demand can be used to characterize real power, reactive power, total power, or current. Peak demand over some period of time is the most common way utilities quantify a circuit's load.

This is also known as "peak coincidence factor" (NYSERDA 2008). More generally, load factor is the average demand divided by any number of peak demands, such as load factor at the time ...

The coincidence factor  $g$  relates peak demand values of individual consumers to the overall peak demand of a group of consumers (as illustrated in Fig. 1). Hence, a larger coincidence factor implies that demand takes place at the same time. This, in turn, necessitates electricity networks that can serve large peak demands.

2.2 Coincidence Factor or Diversity factor  $K_c$  (sometimes written  $K_s$ ) Not all the receivers in an installation operate at the same time. This would obviously lead to unnecessary oversizing. For this reason a reduction factor, known as the coincidence factor, can be applied to the sum of the currents of the various receivers (or circuits).

2.2 Coincidence Factor or Diversity factor  $K_c$  (sometimes written  $K_s$ ) Not all the receivers in an installation

operate at the same time. This would obviously lead to unnecessary oversizing. For this reason a reduction factor, ...

4 Coincident peak demand is the demand of a consumer at the time the system reaches its peak 5 load for the entire year. In the case of ComEd, this generally occurs on a hot summer ... 23 Coincidence Factor = Coincident Peak Demand/Sum of Individual Peak Demand 24 Since the coincident peak must be less than or equal to the sum of individual ...

As such, optimising batteries and charging systems will be a key factor in not having to revise, among other issues, the simultaneity factor, which will modify the power contracted from the service provider or will mean that facilities will need to be altered in car parks or homes. It is possible that, in the future, administrations ...

(f) Low power factor: In most of the LT distribution systems, it is found that the power factor varies from as worse as 0.65 to 0.75. A low power factor contributes towards high distribution losses. For a given load, if the power factor is low, the current drawn is high, consequently the losses proportional to square of the

This paper contains a demonstration of the existence in practice of relationships between group coincidence factors and number of consumers, and between group coincidence factors and consumers' load factors. Empirical relationships developed from test observations are analyzed from theoretical considerations, formulated in a general manner, and qualified as to the ...

Download scientific diagram | Coincidence factor for uncoordinated charging. from publication: Probabilistic Impact Analysis of Residential Electric Vehicle Charging on Distribution Transformers ...

Coincidence factor: It is "the ratio of the maximum coincident total demand of a group of consumers to the sum of the maximum power demands of individual consumers comprising the group both taken at the same point of supply for the same time". Therefore, the coincidence factor ( $F_c$ ) is Coincident maximum demand  $F_c$  =

Coincidence factor is a number that ranges between 0 and 1, which is multiplied to the sum of the expected maximum power per unit connected, to estimate the peak power consumption.
