What is the 2020 grid energy storage technologies cost and performance assessment?

Pacific Northwest National Laboratory's 2020 Grid Energy Storage Technologies Cost and Performance Assessment provides a range of cost estimates for technologies in 2020 and 2030 as well as a framework to help break down different cost categories of energy storage systems.

How much do electric energy storage technologies cost?

Here, we construct experience curves to project future prices for 11 electrical energy storage technologies. We find that, regardless of technology, capital costs are on a trajectory towards US\$340 /kWh for installed stationary systems and US\$175 /kWh for battery packs once 1 TWh of capacity is installed for each technology.

Are energy storage systems cost estimates accurate?

The cost estimates provided in the report are not intended to be exact numbers but reflect a representative cost based on ranges provided by various sources for the examined technologies. The analysis was done for energy storage systems (ESSs) across various power levels and energy-to-power ratios.

Is there a future lifetime cost of electricity storage technologies?

However, existing studies focus on investment cost. The future lifetime cost of different technologies (i.e., levelized cost of storage) that account for all relevant cost and performance parameters are still unexplored. This study projects application-specific lifetime cost for multiple electricity storage technologies.
