Load sway or swing, on cranes, is basically a pendulum effect where the load moves independently of the crane. This does not always matter whilst the load is in the air, although significant swing may affect the load radius and hence the stability of certain cranes, it becomes of great significance when the crane operator is trying to land the load accurately.

to optimise the energy flow in RTG cranes network system by using optimal power management strategies or an MPC controller. Pietrosanti et al. [1] present an optimal management strategy for RTG cranes with flywheel energy storage located at the DC side of the crane. The control strategy aims to find the optimal

Once the hook or lifting device has been connected to the load, the crane operator starts the lifting operation. If side pull is detected, Hook Centering activates. Lift delayed until load centered. While the crane operator continues with the hoist-up command, the crane automatically positions its trolley and bridge over the load.

the inventive crane swing warning system (which is composed of four each of the crane swing warning devices) establishes a highly visible perimeter caution system around the crane's swing radius. It uses warning tape 31, a lightweight plastic ribbon, supported in spaced relation, by four each of the inventive crane swing warning devices 16, which all move in concert with the upper ...
