What is solar thermal plant?

Solar thermal plant is one of the most interesting applications of solar energy for power generation. The plant is composed mainly of a solar collector field and a power conversion system to convert thermal energy into electricity.

What are the different types of solar thermal power plants?

There are two other types of solar thermal power plant. One is a solar pond, a large area of water exposed to sunlight that is designed to maintain a small temperature gradient between its upper and lower layers that can be used to drive a heat engine. This is a relatively low-technology solar thermal plant and it has been rarely used.

Can solar thermal power plants replace fossil fuel power plants?

Solar thermal power plants can replace fossil fuel power plants in their role as base load and peak load generators. For direct, decentralised power supply to industrial areas, smaller CSP systems are economically interesting if the industrial customers buy not only electricity but also process heat. 4. Are solar thermal power plants competitive?

How can a solar thermal power plant withstand a high temperature?

Together with industrial partners, we transfer innovations from the laboratory to large-scale applications. New heat transfer and storage media can withstand temperatures of 600 °C, higher than has previously been possible in solar thermal power plants. This increases the efficiency of converting solar radiation into heat and then into electricity.

How do solar thermal power plants work?

Solar thermal power plants therefore rely on the storage of the intermediate product heat and not the end product electricity. Electricity is generated by means of a steam turbine cycle, which is operated according to demand and is supplied from the thermal storage system.

Why are solar thermal power plants important?

Since solar thermal power plants can feed their electricity into the power grid even after sunset, they are of particular value for an energy system based on renewable energy sources. Solar thermal power plants are of strategic importance in sunny countries to be able to phase out coal and gas power plants in the future.

Solar thermal-electric power systems collect and concentrate sunlight to produce the high temperatures needed to generate electricity. All solar thermal power systems have solar energy collectors with two main components: reflectors (mirrors) that capture and focus sunlight onto a receiver. In most types of systems, a heat-transfer fluid is heated and circulated in the ...
