When the system is discharged, the air is reheated through that thermal energy storage before it goes into a turbine and the generator. So, basically, diabatic compressed air energy storage uses natural gas and adiabatic energy storage uses compressed - it uses thermal energy storage for the thermal portion of the cycle. Neha: Got it. Thank you.

To address this challenge, a model selection platform (MSP) has been developed at Pacific Northwest National Laboratory to review and compare a list of energy storage tools developed by the U.S. Department of Energy national laboratories and suggest the best-suited tools based on users' needs and requirements.
