Shared energy storage has the potential to decrease the expenditure and operational costs of conventional energy storage devices. However, studies on shared energy storage configurations have primarily focused on the peer-to-peer competitive game relation among agents, neglecting the impact of network topology, power loss, and other practical ...

For battery energy storage systems (BESS), the analysis was done for systems with rated power of 1, 10, and 100 megawatts (MW), with duration of 2, 4, 6, 8, and 10 hours. For PSH, 100 and 1,000 MW systems at 4- and 10-hour durations were considered. For CAES, in addition to these power and duration levels,

The EMS uses communication networks to coordinate the operation of various energy resources within microgrids, including renewable energy sources, generators, and energy storage systems. In our study, we have used an optimization-based energy management system for our microgrid operation.

Similarly, In Ref. [50], a non-profit demand-side energy storage aggregator focused on the fairness of service pricing is proposed. The aggregator formulates the charging and discharging plans of energy storage facilities according to peak and valley electricity prices as well as the charging/discharging demands submitted by users.
