Energy storage element parallel OLAR PRO. resistance

The electric fields surrounding each capacitor will be half the intensity, and therefore store one quarter the energy. Two capacitors, each storing one quarter the energy, give half the total energy storage. Since capacitance is inversely related to energy storage, this implies that identical capacitances in parallel give double the capacitance.

A more precise method for impedance-based battery modelling is by using a so-called ZARC element to represent the two distinct processes. The ZARC element is a parallel connection of a constant phase element (CPE) and resistance, which is an arc-shaped impedance. The ZARC element can be expressed as:
