

What is a heat exchanger used for?

Heat exchangers exchange heat in the thermal storage which is stored and retrieved later or can be used as a pre-heating or post-heating devices to save energy. Criteria of design of heat exchangers for various thermal energy storage applications along with their various components are being elaborated.

What is a heat exchanger in thermal energy storage?

On the other hand, the heat exchanger in thermal energy storage corresponds to the structure obtained after morphing through which energy flows from a source, usually the thermal fluid, to the storage material (e.g. a solid or a phase-change material, PCM).

Why are heat exchangers a problem in thermal energy storage?

Still, the main challenge is the design of heat exchangers, as the engineering system that enables the flow of energy from the sources (renewable and non-renewable) to the TSM, disregarded in recent comprehensive reviews on thermal energy storage [6,7].

How effective is a heat exchanger?

As mentioned in Section 2.5, the effectiveness of heat exchanger is usually regarded as an ideal value in previous studies, that is, it is set to be equal in energy storage and energy release phases and is not affected by other parameters.

How does a heat exchanger design affect charging and discharging times?

Namely, this design has a significant impact on the charging and discharging times, if using renewable energy sources, given their limited time-window throughout the day. The standard approach in the design of heat exchangers is to optimize the thermal and hydrodynamic energy flows.

Are shell and tube heat exchangers effective for latent heat storage?

However, the thermal energy storage system with shell and tube heat exchangers is one of the most promising and cost-effective heat exchangers for latent heat storage. Moreover, its performance was investigated in different heat transfer enhancement techniques such as fins and cascaded PCM. Therefore, available data can be used.

The third step is the geometrical design of the LTES system. Mehling and Cabeza [24] identified three geometry types based on the energy transfer method from storage material to system: by heat transfer on the storage surface, by heat transfer on internal heat transfer surfaces, and by transferring the heat storage material itself. The present ...

1 Introduction. Up to 50% of the energy consumed in industry is ultimately lost as industrial waste heat (IWH), [1, 2] causing unnecessary greenhouse gas emissions and ...

Among the several methods of TES, the latent heat thermal energy storage (LHTES) technique has been deemed to be a vital technical means to improve energy efficiency and promote the rapid development of renewable energy thanks to its excellent thermal energy storage capability, small temperature fluctuation, and easy process control [1 ...

Heat exchangers in energy storage. A modern energy supply cannot be guaranteed without renewable energies. One of the central key technologies is the storage of periodically generated energy in decentralized storage facilities, as well as the ...

The efficiency and ability to control the energy exchanges in thermal energy storage systems using the sensible and latent heat thermodynamic processes depends on the best configuration in the heat exchanger's design. In 1996, Adrian Bejan introduced the Constructal Theory, which design tools have since been explored to predict the evolution of the ...

On the other hand, latent heat thermal energy storage (LHTES) systems have a large thermal heat capacity, high energy storage density, negligible temperature change throughout the charge ...

Renewable energy sources are more acceptable and reliable by using efficient and well-design thermal storage. Therefore, enhancing the thermal performance of thermal storage is extensively studied. In the current work, the latent heat storage is a shell and a finned tube heat exchanger, the end of the fins being connected by a coiled spiral. Numerical ...

Parsazadeh and Duan [100] used a CuO water nanofluid as the heat transfer fluid (HTF) and a NePCM energy storage device to investigate a vertical tube heat exchanger LHTES device computationally. A CFD model with an enthalpy porosity approach and response surface methodology (RSM) simulated the system to assess thermal performance parameters.

1 Introduction. Up to 50% of the energy consumed in industry is ultimately lost as industrial waste heat (IWH), [1, 2] causing unnecessary greenhouse gas emissions and increased costs. Recently, there has been a significant amount of research focused on industrial waste heat recovery (IWHR), including advancements in heat exchangers, thermoelectric ...

1. Introduction. Compressed air energy storage (CAES) technology can play an important role in the peak shaving and valley filling of power system, large-scale utilization of renewable energy, distributed energy system development and smart grid [1], [2], [3]. However, there exist only two commercial CAES plants in the world, namely, Huntorf plant, operated ...

The sensible heat of molten salt is also used for storing solar energy at a high temperature, [10] termed molten-salt technology or molten salt energy storage (MSES). Molten salts can be employed as a thermal energy storage method to retain thermal energy. Presently, this is a commercially used technology to store the heat collected by concentrated solar power (e.g., ...

The integration of thermal energy storage (TES) systems is key for the commercial viability of concentrating solar power (CSP) plants [1, 2].The inherent flexibility, enabled by the TES is acknowledged to be the main competitive advantage against other intermittent renewable technologies, such as solar photovoltaic plants, which are much ...

Thermal energy storage (TES) is a technology that stocks thermal energy by heating or cooling a storage medium so that the stored energy can be used at a later time for heating and cooling applications and power generation. TES systems are used particularly in buildings and in industrial processes. This paper is focused on TES technologies that provide a way of ...

Deep borehole heat exchangers (DBHEs) with depths exceeding 500 m have been researched comprehensively in the literature, focusing on both applications and subsurface modelling. This review focuses on conventional (vertical) DBHEs and provides a critical literature survey to analyse (i) methodologies for modelling; (ii) results from heat extraction modelling; ...

The correlation for charging time is based on a structure proposed by Raud et al. [27] which was expanded and has good agreement with data sets found in literature [28]. However, the correlation structure is based on the phase change time and thus linked to the stored latent heat instead of the stored total heat [23], [27]. On the other hand, the charging ...
