Energy storage is the capture of energy produced at one time for use at a later time [1] ... In this mode, dams are one of the most efficient forms of energy storage, because only the timing of its generation changes. Hydroelectric turbines have a start-up time on the order of a few minutes. [6]

Meanwhile, Mode 3 is activated when the energy storage system is depleted, achieving "peak shaving" during high-demand periods on the grid. I do think the storage rule is implemented wrong though - if I look at the specs for the storage mode. Storage mode says: "The Storage mode kicks in whenever the battery has not been subjected to discharge during 24 hours." So, if it was in storage mode, and then inverted for 2 hours, it should definitely not go back to storage mode again.

Storage mode does not really make much sense on a battery that is cycled daily, as would be the case when using ESS. As a result Storage mode should be disabled when using ESS. I ran into this bug myself years ago when still running Hub4, reported it, and as a result VEConfigure will disable storage mode when you configure the ESS assistant.
