**1.1 Motivation.** A good opportunity for the quick development of energy storage is created by the notion of a carbon-neutral aim. To promote the accomplishment of the carbon peak carbon-neutral goal, accelerating the development of a new form of electricity system with a significant portion of renewable energy has emerged as a critical priority.

The amount of energy stored,  $E$ , is proportional to the mass of the flywheel and to the square of its angular velocity is calculated by means of the equation (1)  $E = \frac{1}{2} I \omega^2$  where  $I$  is the moment of inertia of the flywheel and  $\omega$  is the angular velocity. The maximum stored energy is ultimately limited by the tensile strength of the flywheel material.
