Can ultraflexible energy harvesters and energy storage devices form flexible power systems?

The integration of ultraflexible energy harvesters and energy storage devices to form flexible power systems remains a significant challenge. Here, the authors report a system consisting of organic solar cells and zinc-ion batteries, exhibiting high power output for wearable sensors and gadgets.

Can 1D energy harvesting and storage devices be used in wearable applications?

Power systems and electronic devices that are bulky and rigid are not practical for use in wearable applications that require flexibility and breathability. To address this, a range of 1D energy harvesting and storage devices have been fabricated that show promise for such applications compared with their 2D and 3D counterparts.

Are flexible thin-film rechargeable batteries suitable for energy harvesting and storage?

To date, several flexible thin-film rechargeable battery chemistries and architectures 9, 14, 15, 16, 17, 18 and energy harvesting technologies 19, 20, 21, 22 have been reported. However, an effective energy harvesting and storage system requires not only high-performing individual components, but also good compatibility between components.

Recently, single-atom catalysts (SACs), the isolated metal atom singly anchored to the surface of the support, have been the new frontier in the catalytic field because of their high catalytic efficiency, resulting from the separated energy levels with the high occupied and low unoccupied molecular orbital [17], [18], [19], [20]. The high atomic utilization of 100% in SACs ...
