Many Li-ion battery packs can operate only up to 60°C/140 °F before undergoing degradation that prematurely ends the battery's life. The researchers attribute their battery's extended life span, high operating temperature, and safety to the presence of tethered/immobile borate anions in the polymer network.

Conversely, high temperatures accelerate the chemical reactions within a lithium-ion battery, which can result in faster aging and a shorter overall lifespan. In very hot conditions, there is a risk of thermal runaway, where the battery's temperature increases uncontrollably, posing safety hazards.
