Energy Storage Capacitors and Circuitry Required for -72-V Storage Voltage 1,320 µF 1.1 Pump and Dump Circuitry To store energy at high voltage two circuits are required. One circuit must boost the input voltage for storage and the other must dump the energy into the load during transient events. Although

voltage. An alternative solution, high-voltage-energy storage (HVES) stores the energy on a capacitor at a higher voltage and then transfers that energy to the power bus during the dropout (see Fig. 3). This allows a smaller capacitor to be used because a large percentage of the energy stored is used for holdup.

This book presents select proceedings of the conference on "High Voltage-Energy Storage Capacitors and Applications (HV-ESCA 2023)" that was jointly organized by Beam Technology Development Group (BTDG) and Electronics & Instrumentation Group (E& IG), BARC at DAE Convention Centre, Anushakti Nagar from 22 nd to 24 th June 2023.
