Utility-scale energy storage systems for stationary applications typically have power ratings of 1 MW or more. The largest flywheel energy storage is in New York, USA by Beacon Power with a power rating of 20 MW and 15 min discharge duration.

The core element of a flywheel consists of a rotating mass, typically axisymmetric, which stores rotary kinetic energy E according to (Equation 1) $E = \frac{1}{2} I \omega^2$ [J], where E is the stored kinetic energy, I is the flywheel moment of inertia [kgm²], and ω is the angular speed [rad/s]. In order to facilitate storage and extraction of electrical energy, the rotor ...

Beacon Power is building the world's largest flywheel energy storage system in Stephentown, New York. The 20-megawatt system marks a milestone in flywheel energy storage technology, as similar systems have only been applied in testing and small-scale applications. The system utilizes 200 carbon fiber flywheels levitated in a vacuum chamber.

Still, many customers of large-scale flywheel energy-storage systems prefer to have them embedded in the ground to halt any material that might escape the containment vessel. Energy storage efficiency. Flywheel energy storage systems using mechanical bearings can lose 20% to 50% of their energy in two hours. [17]
