The present work proposes an electricity in/electricity out (EIEO) storage system that bridges the gap between the extremes of energy storage time scales, with sudden load imbalances addressed through the introduction of "real system inertia" (in a flywheel) and secondary energy stores (compressed fluid) exploited for sustained delivery over longer time ...

The energy storage battery is also connected to the DC bus by a Buck-boost DC/DC converter, and the charge and discharge of the energy storage battery is controlled by the virtual inertia control algorithm to better stabilize the DC bus voltage.

The intermittent and irregular nature of renewable energy sources necessitates at least some form of energy storage if uninterrupted supply is to be achieved [1]. Mismatches in supply and demand need to be accounted for on a wide range of time scales, from the order of weeks or months as a result of diurnal and seasonal variations [2], to seconds and milliseconds.

The inertia starter motor, with its reliance on the principles of inertia and mechanical threading, represents a foundational technology in engine starting systems. While it has certain drawbacks, including the potential for heavy wear on the gear teeth, its simplicity and effectiveness have made it a durable choice for many applications.

Thus, the generator rotating mass behaves as a kinetic energy storage and provides inertial response (IR). Modern wind power plants (WPPs) are commonly equipped with power electronic interfaces, which decouple the generator speed from the grid frequency. Therefore, the IR of RES is not as inherent as it is in the case of CPPs [4].
