Figure 1) is a relatively low scale compressed air energy storage prototype [6][7][8], making use of a manufactured reservoir to store the compressed air, and a water tank for thermal conditioning.

The primary function of a solar thermal storage tank is to hold the heated water or fluid at a consistent temperature, allowing it to be used for space heating, domestic hot water, or other energy-intensive processes. Solar storage tanks can be classified into two main categories - pressurized and non-pressurized tanks.

Experimental set-up of small-scale compressed air energy storage system. Source: [27] Compared to chemical batteries, micro-CAES systems have some interesting advantages. Most importantly, a distributed network of compressed air energy storage systems would be much more sustainable and environmentally friendly.
