The parallel of inverters is inevitable in the operation of distributed generation with a Microgrid. This research paper presents a new approach to address power quality concerns in microgrids (MGs) by employing a superconducting fault current limiter (SFCL) and a fuzzy-based inverter. The integration of multiple power electronics converters in a microgrid typically increases total harmonic distortion (THD), which in turn results in power quality issues. ...

The microgrid consists of two 5KVA inverters those are connected to a common AC bus based on the assumption that the load is connected to a common AC bus. Each inverter consisted of a single metal-oxide-semiconductor field-effect transistor (MOSFET) full-bridge with a switching frequency of 4000 Hz and an LC output filter with the following ...

Microgrids play a crucial role in the transition towards a low carbon future. By incorporating renewable energy sources, energy storage systems, and advanced control systems, microgrids help to reduce dependence on fossil fuels and promote the use of clean and sustainable energy sources. This not only helps to mitigate greenhouse gas emissions and reduce the [...]

For a microgrid, the implications of being able to capture clipped energy are significant. Specifically, it means that a solar array and battery that are much larger than the inverter can be used, and the solar and battery can be optimally sized to service the continuous load of the microgrid without necessarily having to choose overly large inverters.

A "smart inverter" should offer some features such as plug and play, self-awareness, adaptability, autonomy and cooperativeness. These features are introduced and comprehensively explained in this article.

Depending on the implemented control strategies or operation mode in AC microgrids, inverters can be classified into three groups: Grid-following (GFL) (also called Grid-feeding), Grid-forming (GFM) and Grid ...
