Shared energy storage is a new energy storage business model under the background of carbon peaking and carbon neutrality goals. The investors of the shared energy storage power station are multi-party capital, which can include local governments, private capital, power generation companies and other investment entities.

Energy storage can facilitate both peak shaving and load shifting. For example, a battery energy storage system (BESS) can store energy generated throughout off-peak times and then discharge it during peak times, aiding in both peak shaving (by supplying stored energy at peak periods) and load shifting (by charging at off-peak periods). Below shows examples of a BESS being used ...
