

Planet closest to the moon tonight

Where is the Moon in the sky on September 24?

Sky chart showing The Moon near Jupiter in the morning sky before sunrise on September 24, along with some of the well-known (Northern Hemisphere) winter stars and constellations. Credit: NASA/JPL-Caltech

Is a bright object near the Moon a star or a planet?

A bright object near the Moon can be a star or a planet. You can tell the difference by checking if the object twinkles. If it does, then it's a star; if not, it's a planet. Also, Jupiter and Venus (sometimes Mars and Saturn, too) are way brighter than most stars.

Which planets are visible at night?

Saturn's visible all night. Jupiter and Mars rise in the couple of hours after midnight and are visible in the southeast before sunrise. September 1-7 - If you're in the Northern Hemisphere, you can spot Mercury this week during morning twilight if you can find an unobstructed view toward the east. It appears low in the east just before dawn.

Which supermoon is highest in the sky in 2024?

A full moon rises opposite the sunset, is highest in the sky at midnight and lies low on the western horizon opposite the sunrise. This is the third of four supermoons in a row. And it's the Hunter's Moon, plus it's the closest - largest and brightest - supermoon in 2024.

Where is Saturn in the sky?

Saturn's in the southeastern sky early in the evening. From there it'll be visible overhead all night, and you'll find it setting in the west as dawn approaches. Sky chart showing The Moon near Jupiter in the morning sky before sunrise on September 24, along with some of the well-known (Northern Hemisphere) winter stars and constellations.

Will the Moon & Venus meet on November 4?

On November 4, the 9%-illuminated Moon and Venus (mag -4.0) will meet in the constellation Ophiuchus. The planet will be visible after sunset without any optical aid. As the event will occur three days after the New Moon, the lunar disc will be barely visible.

Now a look at Moon and planet pair-ups for October. On the 13th and 14th after dark, look for the nearly full Moon with Saturn toward the southeast. Then on the evening of October 20th, the Moon rises near Jupiter, with the giant planet looking extremely bright. You should be able to find them low in the east after around 10 pm that night.

Planet closest to the moon tonight

Saturn (0.6) will occur.

Introduction Mercury's surface temperatures are both extremely hot and cold. Because the planet is so close to the Sun, day temperatures can reach highs of 800°F (430°C). Without an atmosphere to retain that heat at night, temperatures can dip as low as -290°F (-180°C). Despite its proximity to the Sun, Mercury is not the hottest [...]
