P0171 - System Too Lean (Bank 1): A common issue within this range, P0171, signals that the oxygen sensor has detected a lean condition in Bank 1 of the engine (the side containing cylinder #1). "Too lean" means there's too much air in the air-fuel mixture, which can lead to poor engine performance and increased emissions.

The ECM has the power to adjust the amount of fuel injected if an increase in the amount of air being fed into the engine is detected. However, when the computer detects incorrect fuel and air ratio, it could trigger the P0171 code. What Does Code P0171 Mean? When the ECM/PCM is having to add too much fuel based on input from the O2 sensor, the fault code ...
