Looked at PCS (power control system) panel and it showed good AC power on both legs with 7 loads shed. There are 7 AC using items that are controllable by the PCS - so all were shed. Looking closer at the PCS panel, it was showing 0 amps on L1 and 106 amps on L2 and 106 amps total. Huh? How can it allow 106 amps to be drawn on a 50 amp circuit?

System: The Power Control System (PCS) consists of two major components: 1.PCS Central Monitor Panel & 2. PCS Panelboard for 50amp service. The Panelboard may optionally have a subpanel built in. a. The Panelboard also houses the PCS Control Module, and has two current sensors Features: Monitor and Manage total RV current to avoid nuisance circuit breaker tripping.

Assemblies for Distribution Panels Power Control Systems (PCS) The Power Control Systems works with the MAGNUM Energy Inverter/Charger to bring the RV industry a revolutionary new concept. In the past, energy management systems operated when 120VAC was available and inverters operated when 120VAC was not available from ... Precision Circuits ...

Overview: Fully automatic Power Control System which requires little to no user interface. The display is there to help the RV user understand power management and the function of the Midi-PCS. The Midi-PCS monitors the total AC current of an RV and prevents circuit breaker tripping by momentarily shedding up to five loads.
