Can rail-based mobile energy storage help the grid?

In this Article, we estimate the ability of rail-based mobile energy storage (RMES)--mobile containerized batteries, transported by rail among US power sector regions--to aid the grid in withstanding and recovering from high-impact, low-frequency events.

Is RMES more economical than stationary battery storage?

Compared to stationary battery storage (Strategy (1)), RMES is more economical for low-frequency events when the distance between regions is small (Fig. 4a). For example, if RMES travels a total of 400 km between regions, it is more economical than stationary batteries when the resources are called upon $\leq 2\%$ per region annually.
