Should closed mines be used for energy storage and geothermal energy plants?

The use of closed mines for the implementation of underground energy storage plants and geothermal energy plants has important environment benefits, but usually higher operation and maintenance costs (O&M) compared to conventional systems.

How can abandoned mine facilities be used to generate energy?

Finally, a CAES plant could be established, using the upper mine galleries for underground air storage; the fact that Lieres is a "dry mine" is ideal for this type of system. Thus, the abandoned mine facilities are efficiently used to generate both electrical and thermal renewable energy. Fig. 5.

What are the operational principles of thermal energy storage systems?

The operational principles of thermal energy storage systems are identical as other forms of energy storage methods, as mentioned earlier. A typical thermal energy storage system consists of three sequential processes: charging, storing, and discharging periods.

How do underground mine closures affect energy storage?

The high number of underground mine closures increases the number of mines available for energy storage, as proposed in this paper. Underground mines usually use lifts in mine shafts to transport the ore. Lifts are made up of several parts, as stated in .

Can coal mining space be used for electrochemical energy storage?

The use of coal mining space for electrochemical energy storage has not yet been commercialized [95], and four key problems still need to be broken through, namely, site safety evaluation of underground space for coal development, construction of electrochemical energy storage geological bodies.
