

Pros and cons of methane energy storage

Is energy storage more efficient in methanol than methane?

In ideal conditions, where no additional energy is required for the reaction and CO_2 is fully converted into products, energy storage is 8% more efficient in methanol than methane. However, the Sabatier reaction can be performed with a lower degree of complexity compared to the CO_2 to methanol reaction.

Is recompression of methane a non-negligible energy consumption?

The energy storage potential of methane is sensibly influenced by the storage pressure selected. For this reason, a non-negligible energy consumption may occur in the recompression of methane for storage. As an example, we calculated the energy requirement to compress methane from 1 to 50 bar to be 20 kJ/mol.

Why is methanol a better energy carrier than methane?

Methanol was found to be a better energy carrier than methane for several reasons, including the lower energy losses in the production process (less water molecules as by-product) and the liquid form at ambient conditions (three orders of magnitude larger volumetric density).

What is the energy storage potential of methanol and methane?

Energy storage potential of the two carriers is compared and optimized. Maximal storage efficiency is 85.3% for methanol and 78.2% for methane. Methanol production from CO_2 is optimized in an energy storage perspective. The optimal energy storage system is designed as a combination of the two reactions.

Is methane a good source of energy?

Recent developments spearheaded by multiple countries with harnessing methane have made it a promising source of energy that could overtake other fossil fuel energy sources (Fig.1). It is considered to be a cleaner alternative to oil and coal, is richer in carbon, and found abundantly in nature.

How long does methane last in the atmosphere?

Methane has an average lifetime of 10 years in the atmosphere as it is primarily removed by conversion to carbon dioxide and water, whereas carbon dioxide has a lifetime of about 100 years.

Some energy sources are cleaner than others. However, all of them have an impact on the environment. You will be surprised to see that, during the manufacturing of parts, some green technologies may pollute and increase the greenhouse effect more than traditional energy sources.
