Solar energy, wind energy and ocean energy are intermittent new energies, while the rest are non-intermittent new energy sources [19]. Among these new energy sources, solar energy and wind energy have now been widely used throughout the world, which can supply approximately 3% of the world's primary energy consumption [20].

Solar energy must be stored to provide a continuous supply because of the intermittent and instability nature of solar energy. Thermochemical storage (TCS) is very attractive for high-temperature heat storage in the solar power generation because of its high energy density and negligible heat loss.

The Photovoltaics (PV) team supports research and development projects that lower manufacturing costs, increase efficiency and performance, and improve reliability of PV technologies, in order to support the widespread deployment of electricity produced directly from sunlight ("photovoltaics").

This technology is involved in energy storage in super capacitors, and increases electrode materials for systems under investigation as development hits [[130], [131], [132]]. Electrostatic energy storage (EES) systems can be divided into two main types: electrostatic energy storage systems and magnetic energy storage systems.

1. Introduction. With energy strategy reform of the world, there is a rapid increase of wind and solar power integrated to the power grid in recent years, which has caused big issues in frequency control and power network stability, such as enlarged peak-valley demand gap and insufficient system peak demand regulation capacity.

Thermal energy storage technology is an effective method to improve the efficiency of energy utilization and alleviate the incoordination between energy supply and demand in time, space and intensity [5]. Thermal energy can be stored in the form of sensible heat storage [6], [7], latent heat storage [8] and chemical reaction storage [9], [10]. Phase change ...
