Make sure you don't have a lithium-ion battery. Your battery has to be either Nickel-Metal Hydride (NiMH) or Nickel-Cadmium (NiCD) in order for this method to work. If you do this method with the wrong battery, the battery will likely be destroyed. All Macs have lithium batteries, and many modern Windows computers also use lithium batteries.

I read on eHow's (now Sciencing) How to Revive Lithium Ion Batteries page that it is possible to revive a dead Li-ion battery by putting it in the freezer for three to seven days, and then letting it get back to room temperature. Can this process work, and if so, how? Notes: Somehow the opposite, i.e. heating (cooking) the battery, is more intuitive to me.

On lithium cells, you will get metallic lithium plating out of the electrolyte when the cell voltage is above 4.3V. Metallic lithium can catch on fire when exposed to (the moisture in) the air. In Lead-Acid batteries, you will begin to electrolyze the electrolyte, causing the battery to vent hydrogen and oxygen. This is **EXTREMELY EXPLOSIVE**.
