I use a Victron 75/15 with a AC power DC power supply at 24V, attached to the solar input, to charge my 12V banks - have done for years - essentially works as a DC/DC converter. Main thing is that the DC power supply needs to be at least about 4 volts higher than the voltage you are aiming to charge at. I have zero problems with it.

The E4360 Modular Solar Array Simulator (SAS) is a dual output programmable dc power source that simulates the output characteristics of a solar array. The E4360 SAS is primarily a current source with very low output capacitance and is capable of quickly simulating the I-V curve of different arrays under different conditions.

After learning about the concept behind is solar power AC or DC you figured out is power from solar panels
