

# Tesla lfp battery vs lithium-ion

Tesla is changing the battery chemistry it uses in all its standard-range electric vehicles to a version with a lithium-iron-phosphate (LFP) cathode, the automaker said Wednesday in its...

What we see in our data: Tesla drivers with LFP batteries in their cars charge beyond 90% far more than Tesla drivers with non-LFP batteries. Most non-LFP models are kept between 50% and 90% state of charge, while most LFP ...

While lithium iron phosphate (LFP) batteries have previously been sidelined in favor of Li-ion batteries, this may be changing amongst EV makers. Tesla's 2021 Q3 report announced that the company plans to transition to LFP batteries in all its standard range vehicles.

Both are lithium-ion cells. LFP cells are 3.2V nominal, with a max charging voltage of 3.65V. LCO/NMC/NCA/LMN cells are 3.6V nominal, with a max charging voltage of 4.2V unless fancy chemical additives are used. In your case, it doesn't matter since the 2016 Model S doesn't have an LiFePO4 battery pack in the 1st place.

The 2022 Tesla Model 3 uses lfp batteries, while the 2019 Tesla Model 3 extended range plus uses lithium-ion batteries. The lfp batteries in the 2022 model allow for charging to 100% daily use, providing a fully charged range of about 270 miles.

As we know, Tesla has long been at the forefront of technology for batteries in electric vehicles (EVs) and offers a variety of battery chemistries that optimize performance, endurance and cost-effectiveness. But two particularly notable batteries that Tesla includes

The LFP battery uses Iron and Phosphate (phosphorus combined with oxygen) in addition to lithium. The main differences for you to consider are that the LFP battery has a slightly shorter range, 253 miles, as opposed to the NCA battery, 263 miles. But that slight difference in range is deceptive.

LFP batteries are generally more affordable compared to NCA batteries, making electric vehicles more accessible to a wider range of consumers. Benefits of LFP Batteries in Tesla Models: Enhanced Safety: LFP batteries offer improved thermal stability, reducing the ...

Lithium-iron-phosphate (LFP) batteries address the disadvantages of lithium-ion with a longer lifespan and better safety. Importantly, it can sustain an estimated 3000 to 5000 charge cycles before a significant degradation hit - about double the longevity of typical

According to a tweet from the Tesla's CEO, Elon Musk, Tesla is shifting its standard-range car batteries from

# Tesla lfp battery vs lithium-ion

lithium-ion to iron-cathode (LFP battery). Musk in his tweet sited...
