

What is grid-scale battery storage? Battery storage is a technology that enables power system operators and utilities to store energy for later use. A battery energy storage system (BESS) is an electrochemical device that charges (or collects energy) from the grid or a power plant and then discharges that energy at a later time

Electrochemical energy storage: flow batteries (FBs), lead-acid batteries (PbAs), lithium-ion batteries (LIBs), sodium (Na) batteries, supercapacitors, and zinc (Zn) batteries
Chemical energy storage: hydrogen storage
Mechanical energy storage: compressed air energy storage (CAES) and pumped storage hydropower (PSH)

That's essentially what synchronous grid-forming technology can do for the electrical grid. Case study: Cape Cod Energy Storage Facility . Late in 2021, SMA commissioned a first-of-its-kind, 57.6 MW synchronous grid-forming energy storage facility which would not have been allowed to interconnect otherwise.

We estimate that by 2040, LDES deployment could result in the avoidance of 1.5 to 2.3 gigatons of CO₂ equivalent per year, or around 10 to 15 percent of today's power sector emissions. In the United States alone, LDES could reduce the overall cost of achieving a fully decarbonized power system by around \$35 billion annually by 2040.
