

Li Xianshan et al. introduced cloud energy storage into microgrids to provide users with “virtual energy storage” services, building a coordination and optimization model for ecological games ...

To enhance the energy-saving level of the building microgrid system, based on the principle of virtual energy storage in the building, the temperature in the building is actively ...

The heat storage property of building envelope is usually modeled into a virtual energy storage (VES), and regarded as a flexibility resource to support the energy scheduling of building energy ...

Building integrated photovoltaic (BIPV) is one of the most efficient ways to utilize renewable energy in buildings. However, the stochastic characteristic of PV power generation and load challenges the optimal dispatch of the BIPV. This paper proposes an optimal scheduling strategy of BIPV microgrid considering virtual energy storage (VES), which intends to further improve ...

PDF | On Apr 27, 2022, Yunfei Mu and others published Day-Ahead Optimal Interval Scheduling for Building Energy System Considering Building Envelope Virtual Energy Storage Uncertainties | Find ...

Due to the energy-buffering and time-shifting effects of air-conditioning (AC) loads and electric vehicles (EVs) in commercial buildings, they exhibit virtual energy storage characteristics similar to energy storage systems, which can be optimized and scheduled in conjunction with PV and energy storage devices for DR (Barala et al., 2021). It ...

thermal storage system, and virtual energy storage system in the building. The virtual thermal energy storage is the indoor energy change caused by the temperature change. The electric load power originates from photovoltaics, energy storage equipment, and the external power grid. From the above process, it is evident that the building ...

This article presents a novel method called "grid-scale virtual energy storage" that harvests free energy storage from properties inherent to control of multiarea power ...

Because buildings have certain heat capacity, when the thermal power changes, the indoor temperature has a relative lag of change, while the feeling to comfortable temperature of the human body lies within a certain range. Based on the energy storage characteristics of buildings, this paper structures the optimal dispatch model of a combined cooling, heating, and ...

First, virtual energy storage model of the building microgrid is established based on the heat storage characteristics of the building itself. Second, a multi-objective optimization model of the building microgrid

considering virtual energy storage is constructed by considering the investment cost and the comprehensive operation benefits as the ...

The building model was created using the building energy simulation software EnergyPlus, and the quantification of each performance indicator of the building's virtual energy storage was developed. Among them, the optimal charging time for this building model is 30 minutes, and the optimal discharging time is 60 minutes.

In fact, the thermal inertia of buildings can be modeled into the so-called virtual energy storage system (VESS) [16], [17], [18]. With the aid of such virtual storage, heating/cooling building demands can be dispatched orderly to derive extra benefits without causing a disturbance to the user's comfort.

The P2P energy sharing strategy is implemented in a fully decentralized manner based on an alternating direction method of multipliers algorithm, and a virtual energy storage model of HVAC systems is established for implementing the co-optimization of energy and reserve between buildings.

Abstract: Building integrated energy system is an effective way to achieve low-carbon buildings. In order to further tap into its demand side adjustable potential and carbon reduction potential, and reasonably allocate the interests of various entities in the building integrated energy system, a two-layer optimization scheduling strategy for building integrated energy system considering ...

In this paper we have theoretically and experimentally investigated the potential of the thermal mass of a residential building to act as virtual energy storage (VES) in a microgrid environment. Developing a simulation framework in Simulink and calibrating the model parameters through extensive experimental trials, we have explored the critical design space and operational ...

The increasingly complex residential microgrids (r-microgrid) consisting of renewable generation, energy storage systems, and residential buildings require a more intelligent scheduling method. Firstly, aiming at the radiant floor heating/cooling system widely utilized in residential buildings, the mathematical relationship between the operative temperature and ...

The concept of a virtual energy storage system (VESS) is based on the sharing of a large energy storage system by multiple units; however, the capacity allocation for each unit limits the operation performance of the VESS. This study proposes an operation strategy of a dynamic VESS for smart energy communities. The proposed VESS operation strategy ...

Energy storage technologies are vital in improving the operation performance of grid-connected distributed energy systems. The adjustability of indoor temperature and the thermal inertia of buildings can form an excellent virtual energy storage. However, there are few studies on the impact of this virtual energy storage on the operation performance of grid-connected ...

Virtual energy storage building

This study presents a virtual energy storage system (VESS) scheduling method that strategically integrates fixed and dynamic energy storage (ES) solutions to optimize energy management in commercial buildings. Fixed ES, such as batteries, provides stable flexibility but is expensive and can be inefficiently operated. In contrast, dynamic ES can be utilized as needed ...

PDF | On Sep 1, 2018, Orthi Sikder and others published Thermal Inertia of a Building as Virtual Energy Storage: A Sustainable Solution for Smart Grids | Find, read and cite all the research you ...

building energy consumption (about 30-40%) [2], so virtual energy storage (VES) technology based on flexible regulation of air conditioning systems has also become current research hotspots. 2. LITERATURE REVIEW AND CONTENT 2.1 Literature review Virtual energy storage is the process of adjusting

An optimal scheduling model for a hybrid energy microgrid considering the building based virtual energy storage system (VSS) is developed in this paper. The VSS model is developed by utilizing the building thermal equilibrium equation taking the heat storage characteristics of building into consideration. Firstly, mathematical models of various ...

Using the Virtual Storage (VS) concept, the thermal inertial of buildings can be exploited to store energy using pre-cooling strategies. As an alternative to grid-level storage, VS could enhance grid resilience for an extended timeframe, while reducing capital investments, grid reinforcements, and allowing renewable energy integration with reduced energy storage ...

The use of renewable energy sources is growing rapidly, but this also means that there are more unknown variables and fluctuations in power and voltage. Virtual energy storage systems can help in solving these issues and their effective management and integration with the power grid will lead to cleaner energy and a cleaner transportation future.

The virtual energy storage system (VESS) is an innovative and cost-effective technique for coupling building envelope thermal storage and release abilities with the electric and heat power conversion characteristics of an air conditioner; this system provides building energy systems (BESs) with adjustable potentials similar to those of conventional battery energy ...

The increasing use of renewable energy sources introduces significant fluctuations in power generation, demanding enhanced regulatory capabilities to maintain the balance between power supply and demand. To promote multi-energy coupling and the local consumption of renewable energy, integrated energy systems have become a focal point of ...

The building model was created using the building energy simulation software EnergyPlus, and the quantification of each performance indicator of the building's virtual energy storage was developed.

The virtual energy storage system (VESS) is one of the emerging novel concepts among current energy

storage systems (ESSs) due to the high effectiveness and reliability. In fact, VESS could store surplus energy and inject the energy during the shortages, at high power with larger capacities, compared to the conventional ESSs in smart grids.

An optimal scheduling strategy of BIPV microgrid considering virtual energy storage (VES) is proposed, which intends to further improve the operating economy of a BIPVs microgrid and reduce the operating cost of the system. Building integrated photovoltaic (BIPV) is one of the most efficient ways to utilize renewable energy in buildings. However, the stochastic ...
