Why is long-duration energy storage important?

The transition to renewable energy sources such as wind and solar, which are intermittent by nature, necessitates reliable energy storage to ensure a consistent and stable supply of clean power. Long-duration energy storage is not a new concept. Pumped hydro-electric storage was first installed in Switzerland in 1907.

What is long-term energy storage & why is it important?

Long-term storage can include seasonal energy storage, which can shift delivery of power to a different time of year. Diurnal storage can shift power delivery over a few days. And, long-duration storage is particularly important for the power grid's transformation to clean energy and what I'm focusing on here.

Why do we need a reliable energy storage system?

The transition to renewable energy sources such as wind and solar, which are intermittent by nature, necessitates reliable energy storage to ensure a consistent and stable supply of clean power. LDES systems will need to be deployed throughout the grid to store energy generated from renewable sources for extended periods.

Why is energy storage important?

By storing that excess power, we can ensure that our electricity grid can keep up with changing demand, whenever and wherever it arises--and that a cloudy day without much of a breeze doesn't leave anyone's home in the dark. Advancing energy storage is critical to our goals for the clean energy transition.

How can energy storage reduce curtailment?

Energy storage can alleviate curtailment by facilitating the efficient use of clean energy resources so that extra production can be stored and used when it's most needed. As renewable deployment increases, the grid flexibility provided by long-duration energy storage will become more relevant and useful.

How can energy storage reduce energy consumption?

This results in a deliberate reduction of electricity output. Energy storage can alleviate curtailment by facilitating the efficient use of clean energy resources so that extra production can be stored and used when it's most needed.

A quick snapshot of energy storage, using some of NREL's data, shows us that 12-hour pumped-hydro storage has dominated the U.S. storage market for a long time. Over time, more batteries of varying sizes have come online. As the need for storage increases, longer duration options are deployed.

Introduction. Long-term energy storage is an essential component of our current and future energy systems. Today, long-term storage (LTS) is easily accessed: energy sits in the form of hydrocarbons and we "discharge" energy from hydrocarbon reserves but never recharge them - fossil resource consumption that is driving our changing climate.
