

Where is the moon right now from my location live

Where is the Moon located?

Moon - See the current position of the Moon! Moon, or Luna in Latin, is planet Earth's one and only natural satellite and the brightest object in the night sky. With a diameter of 2,159.2 miles (or 3,474 km), it is roughly the size of the African continent and is the largest lunar body relative to the size of the object it orbits around.

Where can I find information on the current lunar phase?

For more advanced information on the current lunar phase, you can also visit [Current Moon Phase & Libration](#) or use the awesome online app [Moon Phaser](#). And, of course, for more general information on the Moon's current circumstances you can always check out [the Moon Viewed from Earth](#), as well as [the Moon's Current Location in the Constellations](#).

Where is the Moon from Greenwich?

Today's rise, transit and set times of The Moon from Greenwich, UK (all times relative to the local timezone Europe/London): Moon is above the horizon from Greenwich, UK. Right now it is placed in the South-East direction at an altitude of 3.51 °; above the horizon.

Why is the Moon not visible from my location?

Right now, from the selected location (Greenwich, UK), The Moon is not visible because it is below the horizon. You can check [The Moon Rise and Set Times](#) to know when The Moon will rise from your location. Apparent coordinates:

What if astronauts were on the Moon Right Now?

So if astronauts were on the Moon right now, to them our planet would be exhibiting a phase that--in terms of the proportion visible in sunlight--is the complement of the lunar phase that we currently see from Earth! The scrollable image just below confirms that the Moon is near First or Last Quarter when it crosses Earth's orbit.

Where can I find information about the Moon's nodal passages?

This [Sky Events Almanac](#) from the excellent [AstroPixels.com](#) site gives the times of the Moon's nodal passages, as well as the times of lunar phases, and our [View from the Sun: Interactive View](#) lets you examine them more closely. The Moon's passages through its orbit's nodes become particularly important near the times of eclipses.

2 days ago; The ZHR value refers to the Zenithal Hourly Rate, i.e. the average number of meteors an individual observer could see in an hour, assuming perfectly dark sky conditions. This number is an estimate, the number an observer could see in real conditions depends on the actual intensity of the shower (which can be highly variable) and on the sky conditions.

Where is the moon right now from my location live

Day length today: 11h 12m 12s (Oct 27, 2024) 1 minute, 29 seconds shorter than yesterday (Oct 26, 2024) 48 minutes, 51 seconds longer than winter solstice (Dec 22, 2023). 2 hours, 41 minutes shorter than summer solstice (Jun 21, 2024)
