Working of Wind Power Plant . The wind turbines or wind generators use the power of the wind which they turn into electricity. The speed of the wind turns the blades of a rotor (between 10 and 25 turns per minute), a source of mechanical energy. The rotor then turns on a generator that converts mechanical energy into electricity.

How does a turbine generate electricity? A turbine, like the ones in a wind farm, is a machine that spins around in a moving fluid (liquid or gas) and catches some of the energy passing by. All sorts of machines use turbines, from jet engines to hydroelectric power plants and from diesel railroad locomotives to windmills. Even a child's toy windmill is a simple form of ...

Past efforts to scale down the towering turbines that generate wind power to something that might sit on a home have been plagued by too many technical problems to make such devices practical. Now, however, a new design could circumvent those issues by harnessing the same principle that creates lift for airplane wings.

If you want to harness wind power, you'll need to create a lot of room to set up wind farms. When a vast area is consumed, it changes the surrounding area. As a result, the cost to manufacture goes up. Low wind speeds prevent you from generating enough power. Wind power is susceptible to seasonal and climatic shifts. Unfortunately, wind power ...
