x-ray machines should not be modified without the authorization of RSS. A radiation survey should be done whenever a new sample is placed in the beam, the beam is diffracted, experimental setup changed or equipment is replaced. The analytical x-ray machines usually have a low energy that can be readily shielded with about 1 mm of lead.

X-rays are produced within the X-ray machine, also known as an X-ray tube. No external radioactive material is involved. Radiographers can change the current and voltage settings on the X-ray machine in order to manipulate the properties of the X-ray beam produced. Different X-ray beam spectra are applied to different body parts.

18.2.1 Absorption. The photoelectric absorption of X-rays, as shown in Fig. 18.3, is the dominant effect contributing to the attenuation of incident radiation within the X-ray energy range used in most imaging applications and occurs when an incident X-ray photon interacts with a bound electron in an atom. The probability of an electron occupying a space is generally ...

What is X-ray Irradiation? X-ray starts as an electron beam where electrons are generated and accelerated to gain energy. Electrons are generated in equipment with an energy of 5 to 7.5 MeV (million electron volts) and at a high power in the hundreds of kW (kilowatts). The electrons are then focused on a specific metal target of high atomic number.

In this chapter, the physical principles of X-rays are introduced. We start with a general definition of X-rays compared to other well known rays, e. g., the visible light. In Sec. 7.2, we will learn how X-rays can be
